NATIONAL ASTRONOMICAL OBSERVATORIES, CAS

# Introduction: PSR J2222-0137

A pulsar with  $P = 32.8$  ms in a 2.44-day binary system,  $DM=3.28$  pc cm $^{-3}$   
 $\dot{P} \sim 10^{-20}$  implies: **a mildly recycled process**  
 $e = 0.00038$  implies: the companion is **a white dwarf (WD) star**

Orbital model .....	DDGR
Weighted residual rms ( $\mu$ s)	2.759
$\chi^2$ .....	10629.32
Reduced $\chi^2$ .....	0.9934
<hr/>	
Orbital period, $P_b$ (days) .....	2.44576436(2)
Projected semi-major axis, $x$ (lt-s) .....	10.84802354(10)
Epoch of periastron, $T_0$ (MJD) .....	58002.019280(10)
Orbital eccentricity, $e$ .....	0.00038092(1)
Longitude of periastron, $\omega$ (deg) .....	120.458(1)
Total mass, $M_{tot}$ ( $M_\odot$ ) .....	3.135(19)
Companion mass, $M_c$ ( $M_\odot$ ) .....	1.3153(56)
Rate of advance of periastron, $\dot{\omega}$ (deg yr $^{-1}$ )	-
Derivative of $P_b$ , $\dot{P}_b$ ( $10^{-12}$ s s $^{-1}$ ) .....	0.2634(74) <sup>(a)</sup>
Derivative of $x$ , $\dot{x}$ ( $10^{-15}$ lt-s s $^{-1}$ ) .....	-7.76(48)
Orbital inclination (deg) .....	-
Position angle of line of nodes, $\Omega$ (deg) ...	-
<hr/>	
Derived parameters	
Mass function, $f$ ( $M_\odot$ ) .....	0.229142359(10)
Pulsar mass, $M_p$ ( $M_\odot$ ) .....	1.820(14)

2009/06/23  
  
 2021/05/02

The most massive double degenerate binary known in the Galaxy.
